Release notes

To provide greater transparency, LogicMatter Inc is providing release notes with its PointMatter Reporting Solution (PRS) software packages. These release notes will contain key information such as Features, Resolved Issues, Known Issues, Workarounds and Troubleshooting to make it easy for SIs / FMs to manage their installations.

Company	LogicMatter Inc.
Product	PointMatter Reporting Solution (PRS)
Date	3rd April 2020
Version	1.0.0
Build	20094
Author	LogicMatter Team

Overview

PointMatter Reporting Solution (PRS) is a web-based platform to provide reporting solutions for Compass and for BACnet-compliant Building Management Systems (BMS). PRS is designed using modern frameworks such as .Net Core and Angular 8 with an embedded SQL Express database that runs on Windows operating systems released after 2010.

Guides

1. PointMatter Installation and Configuration Guide
2. PointMatter User Guide

System Requirements

Requires Windows 10 or Windows Server 2012 R2 and Windows Server 2016 with a minimum of 8 GB RAM.

PointMatter Installation requires restart of the Windows OS because PRS requires Microsoft SQL Express and SQL Server Reporting Services installation, for which Microsoft expects an restart

Read the **PointMatter System requirements** in Installation and Configuration Guide before starting the installation.

ReadMe - Important

- **Pending Windows OS updates**
Before installing, make sure that there are no pending Windows OS updates that are required on the Target installation system.
If Windows OS updates or reboots are required, the SQL Server Reporting Services will not get configured properly. See Troubleshooting Guide if this happens.
- **SQL server Reporting services**
If the target installation system is already having SQL Reporting services 2017 installed, PointMatter's PMManager will not be able to install and configure PMReportServer and PMReports. It's a known limitation and will be fixed in subsequent releases.
- **System RAM**
It's recommended to have 16 GB RAM on the PRS installation System.
- **User privileges required for installation and configuration**
 - The user who is installing PointMatter must have admin/installation permissions on the installation system.
 - PMsetup must be launched by selecting "Run As Administrator".
- **PointMatter Portal Login Credentials**
PointMatter Portal requires a user/password to login. Below are the credentials for the manager user. This password can be changed.

UserName: **pmmanager@pointmatter.com**
Password: **pmmanager@Point\$23**
- **PointMatter and PM**
PointMatter Portal is sometimes called PM Portal. "PM" is just a shortened "PointMatter".
- **SMTP User Credentials**
During PointMatter configuration, PointMatter requires a SMTP user credential (email/password) which gets used for sending email reports to end users.
This setting is only for sending email alerts, report notifications etc.

- **Supported Browser and Screen resolution**

- Application is designed and tested for screen resolution 1024x768 and above screen resolutions for UI elements
- LogicMatter recommends using the Chrome browser for better application UI experience.

For other required credentials, refer to credentials.txt file distributed along with PointMatter setup package

New Features

PM Manager

1. PointMatter Gateway Support the Datasync if Compass SQL Server is enabled only for Windows Authentication Mode

PM Portal

1. New Tabbed based look and feel for search results and Ad-Hoc application.
2. Users can now use search objects and perform Ad-Hoc analysis on Alarms and Trendlogs from the the search application
3. Now Users can modify Duration and Resolution from Reports parameters or from Global Date Picker (GDP), the changes made are reflected in both places.

Known Limitations

PM Manager

1. Installation of SQL Express uses a named instance ***“PMEXPRESS”*** that cannot be changed in this version.
2. The PMExpress Database admin ***sa (pmadmin)*** user is set up with a strong password that cannot be changed in this version.
3. In Gateway Setup, scheduling Ad-hoc task is not supported as it is not having any option for the user to enter the Chunk Start and End Date
4. No Option to Edit the Gateway Setup Task schedules
5. The sa user, pmmanager, pmserviceuser and pmuser are four users whose passwords cannot be changed in this version
6. If the PointMatter Reporting solution is installed on a standalone machine, getting the configuration information for the Bacnet POINTS is not supported.
7. *PMManager is not able to install and configure PMReportServer and PMReports, if the target system is already having SQL Reporting services 2017 installed.*
8. In Gateway Setup, Scheduled Task status is not reflecting properly in the Windows Server 2012 environment, Although Tasks gets scheduled and executes.

PM Portal

1. The initial Manager user called ***“pmmanager@pointmatter.com”*** has a very strong password that cannot be changed in this version.
2. The Ad-hoc analysis supports reporting on a maximum of 10 objects in a single chart.
3. Multiline Report Description is not showing in Report List
4. Separate facet lists for Critical Environment and Critical Equipment apps
5. Only PNG format images are supported in Critical Equipment App

6. CSV Download is not supported while Report Preview in PM APPS
7. MarketPlace option is not fully implemented, it's planned for subsequent releases of PointMatter.
8. Portal Login 'Remember Me' option, stores only the user email address, password is not remembered. If a user is using this option, User needs to provide a password each time while logging into the PointMatter portal.
9. While creating reports, partial Mandatory field validations are performed.
10. CSV export is not respecting the global date pickers settings and providing the export with the data for the duration which is saved within the Report.
11. While creating Reports for Trend and Energy, if user is selecting more than 25 Objects, report execution is erroring out and giving message of exceed URL length
12. Application localization - the current version only supports the English locale.
13. Better and descriptive error and warning messages across applications.
14. While using the Custom duration in Global date Picker, Changing only Time is not reflecting in Apps report parameters to preview the reports
[Add in Troubleshoot table for the resolution]

Resolved Issues

PM Manager

1. The Gateway data sync uses a SQL user named as ***"pmuser"*** with limited read-only permissions on source data (Compass database) and has a strong password that cannot be changed in this version.
2. While Tenant creation, Rep and Job names validations are not performed. Users should provide a valid Rep and Job name, which is in accordance with the SQL server Database naming convention.
3. Unable to create the Tenant, if the provided Rep and Job names were used earlier. During the Tenant delete action, the <RepName>_<JobName>_Templates folder in the PMReportServer is not deleted properly.

PM Portal

1. In the Ad-Hoc Analysis App, sorting of columns is not supported.

Troubleshooting Guide

No	Topic	Problem	Workaround
1	SQL Express Installation	Unable to install PMEXPRESS as named instance due to conflict with another SQL Server Instance	Currently you will need to install it in a machine where the PMExpress named instance does not exist. Or change the name of the other SQL instance and run PM Manager
2	IIS Not Installed	If IIS is missing or it is incorrectly setup/configured, PM Manager will not install PM Portal	Re-install and configure IIS correctly and run PM Manager again. <i>Refer to the Installation and configuration guide's section for setting up IIS on respective Windows OS.</i>
3	PM Portal on HTTPS URL	PM Portal can't be configured on HTTPS port by PM Manager	First install the PM Portal on a HTTP 88 port or available port and then manually apply the certificate and change it into HTTPS
4	Database exceeding 10 GB Limit	If a large number of logs are collected and the PRS data 10 GB limit is reached then new data will not load from source database to PRS databases. Gateway sync will fail because of insufficient space in PAS databases.	Use SSMS and request SQL scripts from LogicMatter to purge old data Use SSMS and request SQL scripts from LogicMatter to purge old data
5	PM Manager Logins not working	PMMManager login is not working while launching PM Portal	Check the case sensitivity of your password, since it is very strong pwd, it is most likely a manual error. For credentials refer to the Read Me section in this document or credentials.txt file.
6	PointMatter Template Deployment has failing during installation	If there is a problem installing our templates, it is related to insufficient RAM. In low resource systems/VM, it is observed that occasionally template deployment gets timed out	In insufficient RAM machine SSRS request timeout issues may come, to overcome this provide the sufficient request timeout limit in PMManager config file The Config file is located in [Install Location] \PointMatter\resources\bin\wwwroot\Config\Config.ini Section name: [ServiceConnectionParams] Time format is HH:MM:SS is

			<pre>[ServiceConnectionParams] ConnectionOpenTimeout = 0:5:0 ConnectionCloseTimeout = 0:5:0 MessageSendTimeout = 0:5:0 MessageReceiveTimeout = 0:5:0</pre>
7	SSRS Service in not running	When machine/VM reboots, even if the SSRS is setup for automatic restart, it has been observed that occasionally the SSRS service does not start	This need manual intervention Go to Windows Service Console (services.msc) and restart the SQL server reporting services (i.e change the state from STOPPED to RUNNING state) If the issue still persists, check for pending Windows OS updates, install the Windows updates and restart the system.
8	License validation failed	When license validation fails in PRS components, it shows the message like "License Validation failed".	When the license validation fails, there can be multiple reasons for that. In this situation Contact LogicMatter support for resolution.
9	Reclaim the databases unoccupied space	PRS database size limit reaches the 10 GB, due to unoccupied spaces between SQL database pages	Use SSMS and shrink the database or contact LogicMatter Support
10	Tenant Report Templates folder already exists during Tenant creation(see logs file)	If any of the services(SQL Server(PMEXPRESS)) is not running or ReportServer is not accessible, PM Manager is unable to delete all the components of the existing Tenant	Browse http://localhost/pmreports with Administrator credentials, see the folder name conflicting with <RepName>_<JobName>_Templates, then Delete the folder from the folder menu and retry Tenant creation
11	Tenant ODS/ADS Database already exists during Tenant creation	If SQL Server(PMEXPRESS) is not in Running state, PM Manager is unable to delete all the databases of the Tenant	Connect to SQL Server(PMEXPRESS) if any database name conflicting with the <RepName>_<JobName>_ODS and <RepName>_<JobName>_ADS, then delete the database and retry Tenant creation
12	Changing only Time is not reflecting in Apps report parameters to preview the reports	While using the Custom duration in Global date Picker, Changing only Time is not reflecting in Apps report parameters to preview the reports	Click on the resolution buttons in the report to get the updated time reflected back in the report

Location of PointMatter Log Files

To be shared with LM support for issue analysis and debugging

PM Manager log file	[Installation Location]\PointMatter\resources\logs
Gateway log File	[Installation Location]\PointMatter\resources\bin\wwwroot\<TenantName>\logs
PM Portal log file	[Installation Location]\PointMatter\resources\bin\wwwroot\PmPortal\logs
